

ABSTRACT OF THE DISCLOSURE

There are no other aftermarket handles nor are there any third handles built on to existing invalid or geriatric 5 walkers on the market. Therefore this invention creates a new market or dual purpose for walkers allowing assistance to be possible but still allowing an unassisted walk.

Comparing other walker designs some having a seat opposite the invalid, others having a seat directly in front 10 of them. The model having a seat directly in front of them is preferable ...but standing between the invalids legs while assisting in pushing is not. Hence a handle opposite the invalid to assist is indispensable.

ABSTRACT

The push and pull handle for walkers is a mechanical device consisting of a "U" shaped handle, a single "L" or "J" shaped handle or a club having an "S" type handle linked to a wheeled walker by one or two adjustable or folding anchor points. The device is used as a pull or push handle when attached to a geriatric walker often consisting of four wheels, two handles, brakes and a seat. The device enables a person to push or pull a person seated on the walker seat.
